SIMOM 1:
Case of fire in the L&D OR suite (postpartum)

Introduction
Operating room fires occur approximately 550 - 650 times in the United States annually. The majority of OR personnel are familiar with the acronym RACE (Rescue, Alarm, Contain, Extinguish) in managing fires, but to obtain the best outcomes in the OR it is important for personnel to be familiar with role identification in a team for fire prevention and management. The American Society of Anesthesiologists (ASA) and the Association of periOperative Registered Nurses (AORN) have published guidelines and best practices, but despite their recommendations, the familiarity with team management in OR fires is suboptimal. Often such team training occurs in the main OR of hospitals and infrequently in other OR sites. Fire drills and fire simulations could lead to avoiding delays in prevention and management of intraoperative fires.

Educational Rationale: To teach team skills in managing an OR fire
Target Audiences: Nursing, OB, Anesthesiology, OR personnel
Learning Objectives: As per Accreditation Council for Graduate Medical Education (ACGME) Core Competencies
Upon completion of this simulation (including the debrief) learners will be able to:
- **Medical knowledge**: Describe causes of operating room fires
- **Patient care**: Describe events that led to operating room fire
- **Practice-based learning and improvement**: Describe components of “RACE” acronym, and describe order of application to an operating room fire, will be able identify turning off the medical gas shut-off valves as an action that should be taken
- **Interpersonal and communication skills**: Effectively communicate with others to integrate actions of OR personnel with the charge desk (nurse in charge) to keep patient and team members safe
- **Professionalism**: Demonstrate mutual respect for the expertise of other team members.
- **Systems-based practice**: Identify the location of the nearest fire alarm, nearest fire extinguishers, medical gas shut-off valves for the OR suite, and can demonstrate facility-specific procedure for turning them off
  - Describe the facility’s plan for the evacuation of a patient from the surgical suite to a designated area
  - Identify existing barriers within the system (such as shortages of equipment, personnel, knowledge gaps, institution specific protocols) that needs to be developed or modified to improve patient outcome

Questions to ask after the scenario:
What will be the effect of a fire on surgeries in progress and scheduled cases later in the day?

Assessment Instruments:
1. Learner Knowledge Assessment form (Appendix 1)
2. Simulation Activity Evaluation form (Appendix 2)
Equipment needed and set up:
In-situ OR setup
Mannequin set up in stirrups with blue drapes on legs
20 gauge IV in hand with N saline (that should contain an access port)
Epidural catheter in-situ

Simulation Scenario set up:
The case
Ms Fana Flamingo is a healthy 35-year-old G2P2, who just delivered a baby under epidural analgesia in the labor and delivery suite. There is a sulcus laceration and the patient is in the OR for repair under epidural anesthesia. She has oxygen via nasal cannula.

Simulation pre-brief
• Read the scenario and instruct team members on their role during the simulation
• The learners take their places in the OR
• One obstetrician is a confederate who alerts the learners that a fire has started

Fire drill scenario

Obstetrics Interdisciplinary Team Simulation

Name of simulation: ______________ Date: ______

OB Nursing Anes

Each item has two components. The “Before the simulation” column (left side) examines your perspective at the beginning of the simulation. The “End of Simulation” column (right side) is to evaluate your perspective at the completion of the simulation.

1. How would you rate your knowledge of the acronym RACE as it applies to an OR fire?

<table>
<thead>
<tr>
<th>BEFORE THE SIMULATION</th>
<th>END OF SIMULATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4 5 6 7</td>
